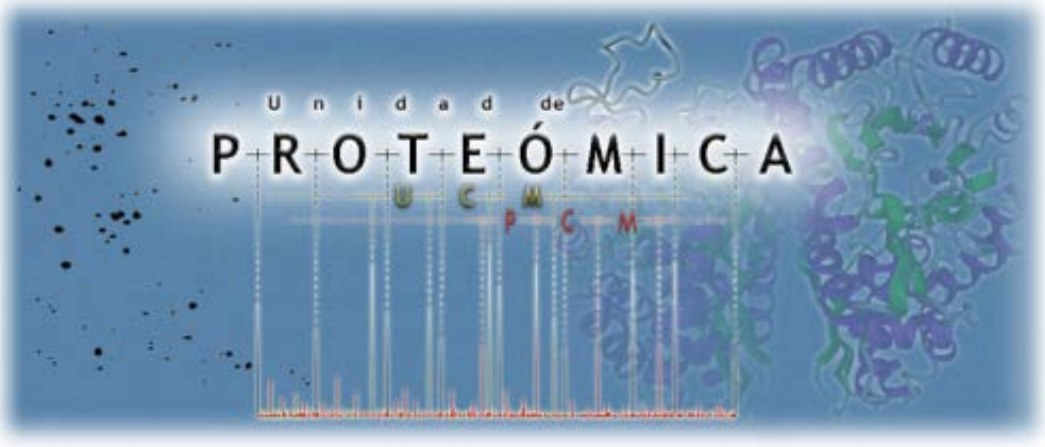
APLICACIONES DE LA PROTEÓMICA EN LA CLINICA

Fernando Vivanco-Departamento de BBM-I/IIS-FJD



CENTROS DE APOYO A LA INVESTIGACION (CAIS)

UCM

Los CAIS de la UCM son un conjunto de **instalaciones imprescindibles** (centros neurálgicos) para el desarrollo de la **actividad investigadora.**

Los CAIS (Unidad de Proteómica) son un verdadero **SERVICIO** a la comunidad científica de la UCM y de otras instituciones.

El desarrollo actual de la ciencia y de la investigación son **Instrumentación-dependiente** y esta dependencia va a incrementarse en el futuro próximo.

La Unidad de Proteómica de la UCM:

-Da servicio a los **investigadores** de la UCM y otra instituciones (OPIS, empresas).

-Pertenece a la red Nacional de Servicios de Proteómica (**PROTEORED**).

-Lleva a cabo **ensayos multicéntricos** a nivel nacional e internacional para garantizar la calidad de sus análisis.

-Participa en la **docencia** de la UCM con cursos y practicas en diversos Masters.

-Participa en el Consorcio Internacional encargado de descifrar el **PROYECTO PROTEOMA HUMANO**.

-**Transfiere** la Tecnología Proteómica a los **hospitales** para su implantación en la clínica humana.

QUÉ ES EN REALIDAD LA UNIDAD DE PROTEÓMICA DE LA UCM para un usuario :

Un local (pequeño) en el que entras con un tubo de ensayo (conteniendo una muestra biológica) y sales con un pendrive (o CD) conteniendo un mínimo de 2 Gigas de información).

Es por tanto un centro **Generador de Datos**:

-De carácter básico (de investigación fundamental)

-De carácter aplicado (investigación aplicada/ traslacional): el ejemplo de la **Proteómica Clínica**

En los últimos 5 años (periodo 2012-2016) nuestro grupo ha producido:

Un total de 61 publicaciones, de las cuales **52** contienen datos fundamentalmente obtenidos:

- en el **CAI de Proteómica** de la UCM (**Proteínas**)

- en el **CAI de Resonancia Magnética Nuclear** de la UCM (**Metabolitos**)

Patients with calcific aortic stenosis exhibit systemic molecular evidence of ischemia, enhanced coagulation, oxidative stress and impaired cholesterol transport. *Int J Cardiol*. 2016 Sep 26;225:99-106.

Hypertensive **patients** exhibit an altered metabolism. A specific metabolite signature in urine is able to predict albuminuria progression. *Transl Res*. 2016 Jul 15. pii: S1931-5244(16)30108-6.

Plasma Molecular Signatures in Hypertensive **Patients** With Renin-Angiotensin System Suppression: New Predictors of Renal Damage and De Novo Albuminuria Indicators. *Hypertension.* 2016 Jul;68(1):157-66.

Detection of major food allergens in amniotic fluid: initial allergenic encounter during pregnancy. *Pediatr Allergy Immunol*. 2016 Jun 24. doi: 10.1111/pai.12608.

Urinary Kininogen-1 and Retinol binding protein-4 respond to Acute Kidney Injury: predictors of **patient** prognosis? *Sci Rep*. 2016 Jan 21;6:19667. doi: 10.1038/srep19667.

Urinary alpha-1 antitrypsin and CD59 glycoprotein predict albuminuria development in hypertensive **patients** under chronic renin-angiotensin system suppression. *Cardiovasc Diabetol.* 2016 Jan 16;15:8. doi: 10.1186/s12933-016-0331-7.

KLK1 and ZG16B proteins and arginine-proline metabolism identified as novel targets to monitor atherosclerosis, acute coronary syndrome and recovery. *Metabolomics.* 2015;11(5):1056-1067.

Plasma Molecular Signatures in Hypertensive Patients With Renin–Angiotensin System Suppression: New Predictors of Renal Damage and De Novo Albuminuria Indicators

Montserrat Baldan-Martin, Laura Mourino-Alvarez, Laura Gonzalez-Calero, Rafael Moreno-Luna, Tamara Sastre-Oliva, Gema Ruiz-Hurtado, Julian Segura, Juan Antonio Lopez, Jesus Vazquez, Fernando Vivanco, Gloria Alvarez-Llamas, Luis M. Ruilope, Fernando de la Cuesta*, Maria G. Barderas*

Abstract—Albuminuria is a risk factor strongly associated with cardiovascular disease, the first cause of death in the general population. It is well established that renin–angiotensin system suppressors prevent the development of new-onset albuminuria in naïf hypertensive patients and diminish its excretion, but we cannot forget the percentage of hypertensive patients who develop de novo albuminuria. Here, we applied multiple proteomic strategy with the purpose to elucidate specific molecular pathways involved in the pathogenesis and provide predictors and chronic organ damage indicators. Briefly, 1143 patients were followed up for a minimum period of 3 years. One hundred and twenty-nine hypertensive patients chronically renin–angiotensin system suppressed were recruited, classified in 3 different groups depending on their albuminuria levels (normoalbuminuria, de novo albuminuria, and sustained albuminuria), and investigated by multiple proteomic strategies. Our strategy allowed us to perform one of the deepest plasma proteomic analysis to date, which has shown 2 proteomic signatures: (1) with predictive value of de novo albuminuria and (2) sustained albuminuria indicator proteins. These signatures are related to inflammation, immune as well as in the proteasome activation occurring in situations of endoplasmic reticulum stress. Furthermore, these results open the possibility of a future strategy based on anti-immune therapy to treat hypertension which could help to prevent the development of albuminuria and, hence, the progression of kidney damage. (*Hypertension*. 2016;68:00-00. DOI: 10.1161/HYPERTENSIONAHA.116.07412.) • Online Data Supplement

Key Words: albuminuria ■ cause of death ■ hypertension ■ immune system ■ renin-angiotensin system
