With 1 figure and 2 tables in the text

Abstract

We have assessed the geographical distribution of sturgeon (*Acipenser sturio* L., 1758) in the Iberian Peninsula, based on a critical analysis of the literature published in the XIXth and XXth centuries, and a review of the fish collections housed in Spanish institutions. Captures and records of sturgeon have been reported in the Cantabrian, Atlantic and Mediterranean Iberian coasts, and in the Balearic Islands. Concerning running freshwaters, sturgeon has been reported from the rivers Urumia (Cantabrian Sea); Miño, Duero, Guadiana and Guadalquivir (Atlantic Ocean), and Júcar, Turia and Ebro (Mediterranean Sea). In the early eighties, sturgeon still survived in the rivers Duero and Guadiana (Portugal) but its presence has not been further reported. If occurrence could be confirmed, they would actually represent the unique river populations of sturgeon in the Iberian Peninsula. Last sturgeon known to be fished in Spanish waters was in 1975. Sturgeon in Spain was protected by law in 1983 and was considered "endangered" in 1986.

ALMAÇA (1988) made a very valuable overview of the presence of sturgeon (*Acipenser sturio* L., 1758) in Portugal. We present here a general survey of the known data from Spain to complete the present knowledge of Iberian records, with some further comments about the actual status of Spanish populations.

Iberian Peninsula

Known records of sturgeon in Spanish freshwaters and seas are gathered in Table 1. Likewise, Fig. 1 presents a map with the Spanish localities listed in Table 1, together with those belonging to Portugal (ALMAÇA 1988).

Sturgeon seemed to be rather common in the Iberian rivers and seas, and it was quite abundant at less in the rivers Ebro, Duero and Guadalquivir. Never-

theless, after the decline affecting to its reproductive populations along this century, the last known records of sturgeon in the Iberian rivers are:

River Duero: Solitary adult (1983 and 1984) and juvenile (1972) specimens reported from Portuguese waters by ALMAÇA (1988).

River Guadiana: Adult (1970s) and juvenile (1980s) specimens reported from Portuguese waters by ALMAÇA (1988).

River Guadalquivir: Adult specimens (one from 1974 and one from 1975) reported by HERNANDO (1975).

River Ebro: After SOSTOA & LOBON-CERVIA (1989) the last adult specimens were fished during 1940s—1950s, while the last juvenile known to be captured was in 1951 (ANONYMOUS 1952).

Spain

With regard to the Spanish collections, only ten preserved specimens of sturgeon are known to be housed in four Institutions (Table 2).

Sturgeon has never been an abundant species in Spain, although it was commonly captured in the rivers Ebro and Guadalquivir. Sturgeon population from Guadalquivir was exploited for caviar and smoked flesh production from 1930s to 1960s (ELVIRA et al. in press). Nevertheless, this population is now exhausted (see ELVIRA et al. in press, for the causes of decline). Sturgeon fishery was forbidden by law in Spain in 1983. And later on, ICONA (1986) included sturgeon in the Red List of Spanish Vertebrates, where it was considered as “endangered” (“E” after the I.U.C.N. categories).

ICMB(LB)	1 ex.	Mediterranean Sea near Blanes (Gerona)	VII. 1949	ARTÉ (1949)

A restoration programme for sturgeon in Spain has been recently proposed (ICONA 1986, ELVIRA et al. in press). Otherwise, sturgeon survival is highly unlikely.
