

CICLO DE SEMINARIOS 2016-2017
DEPARTAMENTO DE QUIMICA-FÍSICA I
UNIVERSIDAD COMPLUTENSE DE MADRID

Viernes 11 de Noviembre de 2016 – 12:30 h
Sala de la Antigua Capilla

**Engineering photoactive supramolecular architectures:
lights, camera, action!**

Matteo Mauro

Nowadays, precise control of long-range order functional architectures over nano- to micro-meter scale still represents a challenge. Also, self-assembly through weak noncovalent interactions has been shown to provide a powerful bottom-up approach to organize molecules in supramolecular structures with properties superior to common bulk materials. During the first part of the talk, a class of platinum(II) complexes featuring metallophilic interactions will be presented.^[1] Such molecules are able to self-assemble into either achiral^[2] or chiral^[3] highly luminescent fibers that show polarized light emission. Furthermore, their self-assembly capability have been employed for unraveling evolution of complex biomimetic assembly processes in and out of the thermodynamic equilibrium in real-time.^[4] Finally, supramolecular approaches have been used for designing dynamic photoswitchable metallopolymeric materials able to form multiresponsive self-healable gels that display either mechanical actuation^[5] or reversible phase transition^[6] upon a suitable Photonic stimulus.
