On the genus of meromorphic functions

Ricardo Pérez Marco
(CNRS, Univ Paris XIII)

Abstract. We define the class of Left Located Divisor (LLD) meromorphic functions and their vertical order $m_0(f)$ and their convergence exponent $d(f)$. When $m_0(f) \leq d(f)$ we prove that their Weierstrass genus is minimal. This explains the phenomena that many classical functions have minimal Weierstrass genus, for example Dirichlet series, the Γ -function, and trigonometric functions.
