

RESUMEN ESTUDIO HISTOLOGÍA BIOPSIAS PALATINAS

En este estudio clínico, se analizaron biopsias palatinas de bolsas periodontales profundas y superficiales. Se observó mayor área de infiltrado inflamatorio en tejido conectivo y mayor concentración de las citoquinas proinflamatorias IL-1 β e IL-6 en bolsas periodontales profundas, frente a bolsas periodontales superficiales.

In this clinical study, shallow and deep periodontal pocket biopsies were analysed. Higher area of connective tissue inflammatory infiltrate and higher IL-1 β and IL-6 proinflammatory cytokines concentration were observed in deep periodontal pocket compared to shallow periodontal pockets.
